

Business Exchange Services (BES)

File eXchange Services (FXS) Overview

What is FXS?

File eXchange Service (FXS) is a high-speed managed file transfer service to securely exchange content.

- Accessible via a web GUI¹, secure encrypted transfers over HTTPS.
- Complies with industry standard security policies.
- Any file, any size².
- Uses multiple streams to transfer files up to 10 times faster³ than traditional transfer methods (for example FTP/SFTP). Additionally, files can also be compressed in transit.
- Resume downloads from last position in the event of temporary network disconnections.
- Allows files to be transferred in parallel.
- Compartmentalises the storage of your files (only the owner can access their files).
- Allows users to create shares, with specific permissions, to share files with other members of their team.
- Create temporary transfer permits to exchange content.

¹ A command line tool is also available to script transfers.

² Subject to agreed storage quotas.

³ The speed of transfer is always dependent on local network performance (end to end).

Usage Requirements

The minimum requirements to use FXS are:

- Web browser for GUI access [officially supported list below]
 - Internet Explorer (IE) [7.0¹ and higher²]
 - Mozilla Firefox [3.6 to 52³]
 - Safari [5.0 and higher]
 - Chrome [26.0 to less than 42.0³]
- Java JVM [1.7 and higher]⁴
- For downloads, local storage capacity greater than the download file size⁵
- Internet access to reach the FXS Servers with sufficient bandwidth to meet transfer requirements.

¹ IE 7.0 cannot handle files greater than 4GB. IE 8 or higher is recommended.

² IE versions greater than 7.0 can sometimes be recognised as lower versions due to compatibility mode, this warning may be ignored.

³ Versions greater than specified do not support the Java NPAPI plugin anymore.

⁴ Java 1.7 update 45 is not recommended for use with FXS as this will result in an annoying security message every time you login to FXS.

⁵ If the download location is on a different drive to the installation of Java you require double the space (file size on the Java drive and file size on destination drive).

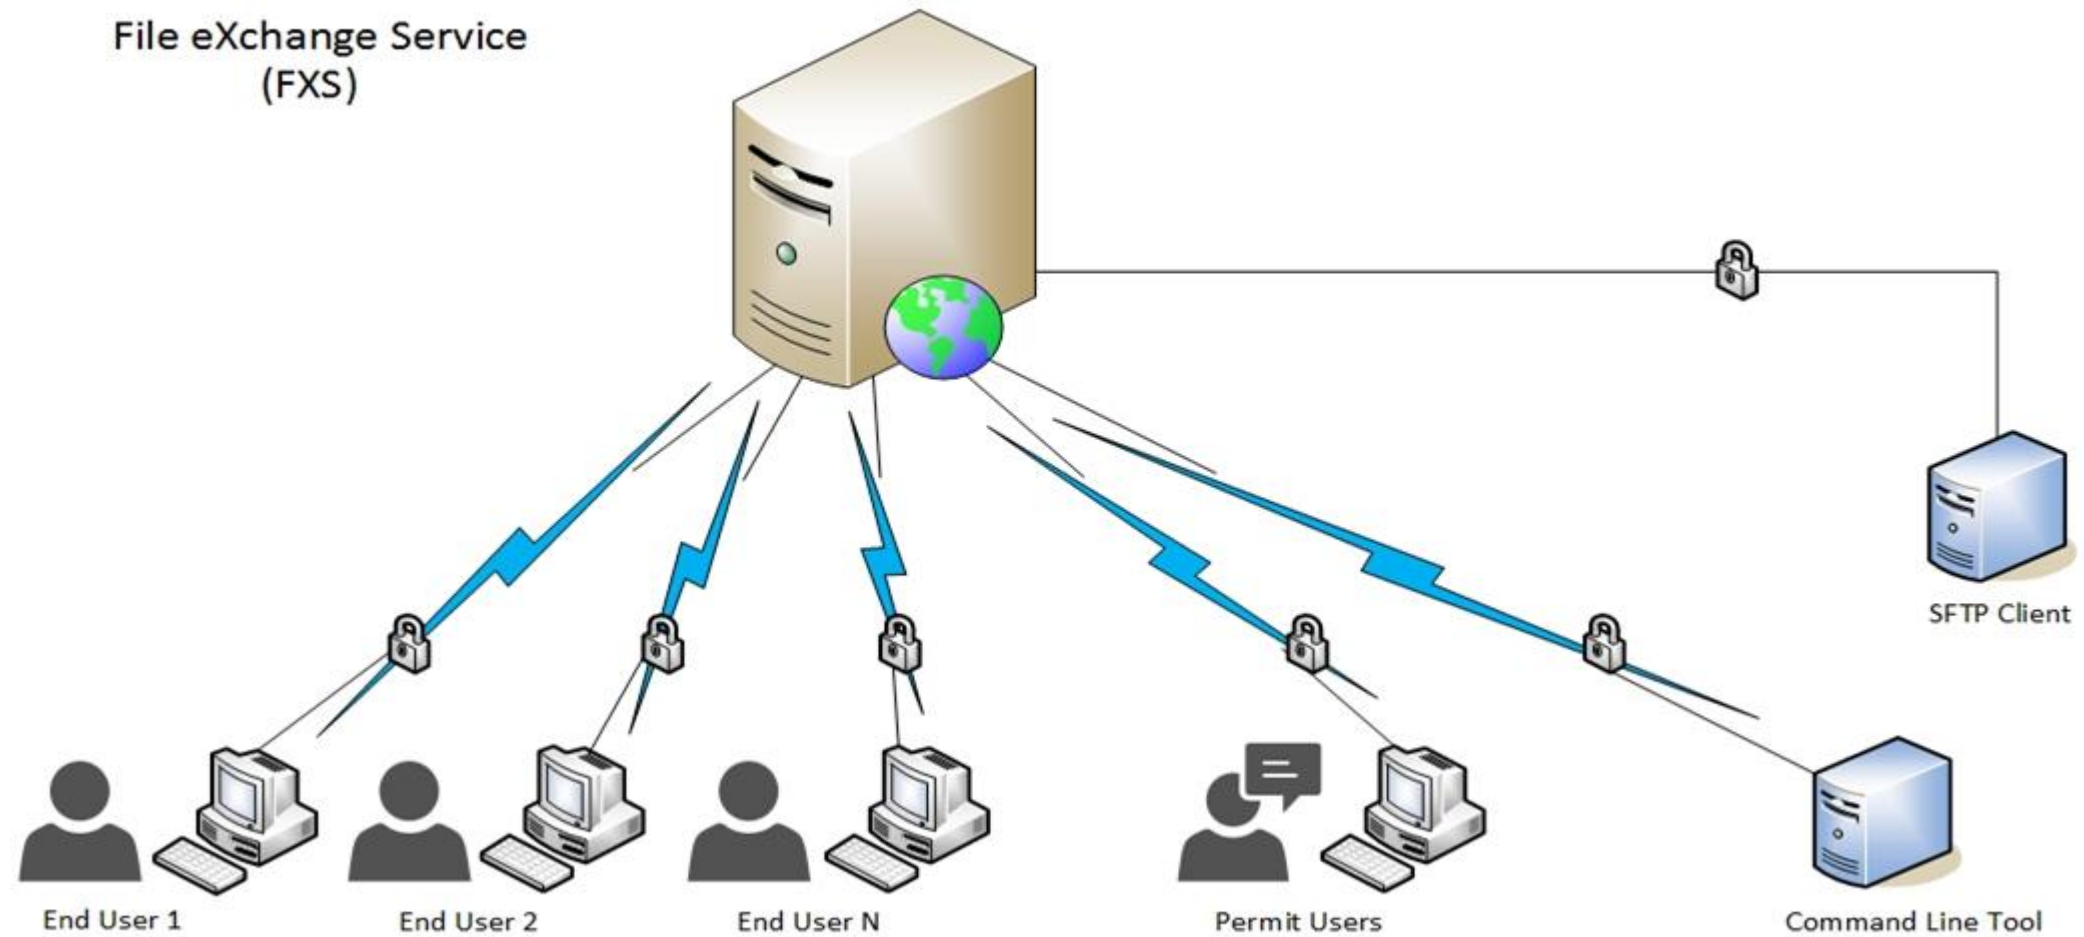

Key Benefits

	Description
Secure High-Speed Transfers	All transfers to/from FXS are encrypted over a HTTPS connection. Utilises multiple streams to transfer files faster than traditional methods [(S)FTP, HTTP(S), etc].
Ease of Use	Simple user interface that allows non-technical end users to transfer files with ease.
Secure Storage	Due to the compartmentalization of data storage, only the account owner of a file can access it.
Sharing and Collaboration	Full set of access permissions to share files with other team members. Files can be shared on a 1 to 1 basis or by group for collaboration.
Pause/Resume Transfers	Ability to pause and resume from last position. Temporary network disconnects will resume from last position.
Respects Network	Unlike UDP based transfer solutions which can flood the network and impact other network users or applications, FXS uses multiple TCP streams. Transfer speeds can be throttled by reducing the number of streams where bandwidth is low.
No Limitations	Any file type of any size can be transferred.
Temporary Transfer Permits	Adhoc transfers via temporary transfer permits. Up/downloads can be limited by time, volume and number of files. Permits automatically expire or become invalid if limits are exceeded.

Notes

	Description
Backups/Restores	FXS cannot be considered a system of record. Due to the compartmentalisation of data it is impossible for our team to restore individual files, therefore the source of the data must be backed up elsewhere. We can only do a complete restore in the event of a disaster.
No Internal Automation	FXS has no internal automation ability, files must be pushed in and pulled out.
External User Accounts	External users have no storage area by default. For external users to transfer data to/from FXS, an employee must grant them access to a share.
Auto-Cleanup	Files are automatically deleted (into the recycle bin) after 30 days.
User Access	User access (both internal and external) is managed by your team. The FXS support team does not manage user access post onboarding.

FXS Connectivity

Connectivity Options

Transfer Type	Description
Manual (High Speed)	Use any modern web browser in which a user initiates up/downloads via the FXS GUI/Transfer Manager (requires Java and the browser must support NPAPI plugins).
Automated (High Speed)	Use the FXS command line Java Jar file to automate transfers.
Manual (Lower Speed)	Use any SFTP client software^ to have a user initiate file transfers. ^For example: WinSCP, FileZilla, etc.
Automated (Lower Speed)	Script/code a solution to automate transfers over SFTP.
	Note: The FXS team does not have any canned/packaged scripts/code samples. The FXS team does not have any developers to automate your transfers, you need to obtain/use your own developers. The FXS team will assist usage of the command line Jar but we are not developers.

Sample Transfer Statistics

Location*	Size	Rate	Time Required (HH:MM:SS)	Transfer Type
Germany	32GB	22.45 MB/s	22:31	Download using FXS command line client
Germany	32GB	14.21 MB/s	35:34	Upload using FXS command line client
Germany	32GB	660KB/s	~14:30:00	Upload via SFTP
US	30GB	2.45 MB/s	3:12:27	SFTP upload
US	30GB	19.82 MB/s	54:00	Upload using FXS command line client
US	30GB	9.6 MB/s	1:06:00	Download using FXS command line client
Ireland	2.97GB	530.32KB/s	1:38:09	SFTP download
Ireland	2.97GB	8.97MB/s	05:40	Download via FXS transfer manager

**All transfers initiated off corporate network*

Thank you.
